The National Seismic Hazard Maps highlight areas prone to earthquakes, with a focus on the Quaternary period. This map includes Seismogenic Features for regions with fault activity, such as the Rockaway fault and the Southern Whidbey Island fault zone. The map categorizes soil types and age of geological features, aiding in the assessment of seismic risk. Key locations like Utsalady Point and Strawberry Point are marked with fault lines, indicating regions of potential seismic activity. This information is crucial for urban planning and infrastructure development in vulnerable areas.
