Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

WATER SYSTEM COORDINATION

Introduction

The Island County Water Resource Advisory Committee (WRAC) is tasked with developing a Watershed Plan. The goal of Watershed Planning is to determine the availability of the groundwater resources in Island County, and to ensure safe and adequate water supplies. Groundwater resources throughout the county are experiencing increasing demand, and in some areas are expected to be inadequate in the future. Water system coordination would contribute to improvements in public health, groundwater resource management, and resource protection and planning.

Issues and options discussed in this topic paper include public water system coordination, existing water system management, public water system consolidation, and groundwater redistribution. Issues from the “Exempt Wells” and “Water Supply Options” topic papers have been carried over for further discussion in this topic paper.

Definitions

Public Water System: Any water system with two or more connections is considered a public water system. These are multi-party systems that serve the broader public, and as such are regulated to protect public health. Public Water Systems, unless owned by a governmental entity like a city, town or district, are owned and operated by private individuals, groups of private individuals, or community organizations.

Municipal System: The recently passed Municipal Water Law (House Bill 1338) defined all Group A community public water systems (i.e. 15 or more connections) as municipal systems. The Municipal Water Law provides greater certainty and flexibility for water rights held by public water systems, and more closely ties water system planning and engineering approvals by the Washington Department of Health (DOH) to water rights administered by the state Department of Ecology (DOE). The Municipal Water Law requires DOH to change many of the processes and procedures it uses to approve water system plans. Interim requirements (see DOH publication #331-256) will remain in effect until DOH establishes long-term processes that will be phased in over the next three years.

Background

Water System Plans

Water System Plans are required under WAC 246-290 and are overseen by the Washington Department of Health (DOH). The purpose of a Water System Plan is to provide a uniform process for water purveyors to demonstrate the system's operational, technical, managerial

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 and financial capability, demonstrate how the system will address present and future needs,
2 and to establish eligibility for funding pursuant to the State drinking water revolving fund.
3 DOH, Department of Ecology (DOE), and County departments coordinate in regards to
4 Water System Plans.

Coordinated Water System Plans

8 The Water System Coordination Act (Coordination Act, WAC 246-293) was developed in
9 accordance with the authority granted in the Public Water System Coordination Act of 1977
10 (Chapter 70.116 RCW) with the purpose of developing a program to coordinate public water
11 systems within the State of Washington. Specifically, it was developed to identify areas that
12 are critical water supply service areas and to provide a framework for coordinated water
13 system planning in those areas. A critical water supply service area is defined as an area
14 having problems related to inadequate water quality, unreliable service, or lack of
15 coordinated planning. Only water purveyors within a critical water supply service area are
16 required to participate in the Coordinated Water System planning process. DOH provides
17 oversight for coordinated water system plans.

18 A coordinated water system plan is either a compilation of all of the water system plans
19 within its geographic boundary (along with supplemental provisions addressing water
20 purveyor concerns) or is a single plan covering all affected public water systems. The
21 Coordination Act initially required all public water systems created after September 21, 1977
22 to prepare an individual water system plan. This requirement had been eliminated for Group
23 A community public water systems (i.e. 15 or more connections) that do not intend to
24 expand beyond their existing service area boundaries.

25 A coordinated water system plan must address the following:

- 29 - Assess related, adopted water system plans;
- 30 - Identify future service areas;
- 31 - Designate minimum area-wide water system design standards;
- 32 - Include utility service review procedures;
- 33 - Include satellite management requirements;
- 34 - Include policies and procedures to address failing water systems; and
- 35 - Contain compilation of existing water system plans.

Preliminary Assessment of Island County Water System Issues

39 In 1985 a Preliminary Assessment of Island County water system issues identified the
40 following threats to the delivery of safe, efficient and reliable water sources:

- 42 - Proliferation of small water systems;
- 43 - Possible inadequacies of groundwater supplies;
- 44 - Lack of coordination between adjacent water utilities;
- 45 - Water quality problems such as iron, manganese, and seawater intrusion;

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 || - Operation and management of small water systems, including funding of
2 || improvements; and
3 || - Lack of consistency between water system planning and County land use
4 || planning.

5 || Due to the variety and depth of these problems and concerns, the Preliminary Assessment
6 || recommended implementation of the Coordination Act in Island County. The Board of
7 || Island County Commissioners adopted implementation of the Coordination Act in 1985.

Island County Coordinated Water System Planning Process

12 || The entirety of Island County is contained within one critical supply service area, and
13 || therefore is covered by one Coordinated Water System Plan. The 1990 Island County
14 || Coordinated Water System Plan (CWSP) was intended to guide water utilities so that water
15 || supply planning could be accomplished through coordinated rather than piecemeal efforts.
16 || The CWSP contains forty-three recommendations in the areas of administration, water
17 || resource strategy, water purveyor planning and operations and land-use strategy. One of the
18 || guiding principles of the plan was to minimize the proliferation of small systems while
19 || maximizing the coordination of larger systems consistent with land-use planning efforts.

21 || The CWSP provides administrative procedures and a regional strategy for management and
22 || development of public water supplies. This document was meant to work in tandem with the
23 || Island County Groundwater Management Plan (GWMP). The GWMP establishes methods
24 || to properly monitor and protect the quality and quantity of the groundwater resource, meet
25 || future resource needs, and integrate state and local policies. Both function to supplement
26 || adopted Island County land use policies.

Growth Management Act and Comprehensive Land Use Planning

30 || In 1990, Washington State's Growth Management Act (GMA), RCW 36.70A, provided for
31 || comprehensive planning with local control, with the intent of encouraging conservation,
32 || responsible use of lands and resources, and sustainable economic development. The GMA
33 || required the adoption of comprehensive land use plans to designate urban growth areas for
34 || concentrated development and growth. This concentrated growth also provides a structure
35 || such that increasing populations in urban areas are served by a regulated water source rather
36 || than an exempt (from water right requirements) Group B system (i.e., 2-14 connections) or
37 || individual well.

39 || The GMA requires reassessment of land use if probable infrastructure funding falls short of
40 || meeting existing needs and to ensure that the land use element, capital facilities plan element,
41 || and financing plan within the capital facilities plan element are coordinated and consistent
42 || (RCW 36.70A.070(3)(e)). If this coordination effort is combined with watershed planning to
43 || address actual water availability, long-term decisions can be managed incrementally and
44 || locally to provide for the best use of water and land resources. By integrating watershed

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 planning with other land use and resource use decision-making, entities in the watershed may
2 adopt a combined conservation and management approach. This coordinated land use and
3 water system planning would provide for growth and increased capacity.

Water System Issues and Options

Coordination of Public Water Systems

10 There are three main reasons for promoting coordination between water systems. The first is
11 to ensure a safe and reliable water supply for an affordable cost. From a public health
12 standpoint, groundwater is a limited public resource that must be protected. Coordination
13 between systems allows for the best use and sharing of this public resource. The Island
14 County Coordinated Water System Plan (CWSP) contains tools for requiring systems to
15 comply with upgrades, thereby protecting public health. The second reason for water system
16 coordination is to improve the efficiency of agency and utility interactions. Clear delineation
17 of responsibilities between Island County and Washington Department of Health (DOH)
18 would greatly support water system operators and managers. Due to limited groundwater
19 resources, there has been a tendency in Island County for purveyors with supply problems to
20 expect solutions from local government, and for those with adequate supply to curtail
21 customer growth in order to protect those supplies. Improved procedures and
22 communication would alleviate the impacts of these ongoing problems. The third reason for
23 coordination is to help water systems work together and share information and resources.

24 The overall objective of water system coordination is to enable systems to jointly address
25 current and future water supply issues, based on local needs and resources. "Coordination"
26 encompasses two goals: 1. to implement procedures for adjoining water systems to address
27 water supply needs in an orderly and coordinated way (see Option #1: Update and
28 Implement the CWSP, below), and 2. to foster a communication structure between water
29 systems so that information and resources can be shared (see Option #2: Water System
30 Associations, below).

Option #1: Update and Implement the CWSP

35 The 1990 Island County Coordinated Water System Plan (CWSP) is a policy and procedure
36 framework for ensuring the reliability of the groundwater resource. In its executive summary
37 the CWSP states the following: "The CWSP is a policy framework in which utilities, agencies
38 and the public can begin to focus and prioritize efforts to ensure the reliability of the
39 County's entire existing water resource and prepare for future needs in an orderly and
40 efficient manner."

41 The CWSP primarily focuses on coordination between water systems and resolving
42 boundary disputes. Updating and improving the implementation of the CWSP would enable
43 purveyors and agencies to better manage and develop public water supplies.

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 The approval of the CWSP in 1990 represented a major step forward in groundwater
2 resource management in Island County, and its recommendations are still relevant today.
3 The “Water Supply Alternatives” topic paper reconfirmed Board of Island County
4 Commissioner support of the CWSP.

5 Some of the recommendations in the CWSP have been or are being implemented. However,
6 most of the issues cited in the 1985 Preliminary Assessment of water systems have not been
7 resolved and are more prominent today than when the CWSP was enacted. Implementation
8 of the CWSP has been inconsistent and there is still a need for one county department to
9 take a strong lead. The CWSP recommended forming a Public Works Department to take
10 the lead in implementation; although this department was created it did not take the lead for
11 implementing the CWSP. Some of the key enforcement measures recommended in the
12 CWSP have not occurred (i.e. meeting design standards), and efforts between Island County,
13 DOH and the Washington Department of Ecology (DOE) have not been coordinated.

14 Although the Island County CWSP recommended that it be reviewed every five years, this
15 has not occurred. However, under the E2SSB 5448 revision, a coordinated water system
16 plan needs updating only when the local legislative authority or DOH determines it is
17 necessary. The update may be limited in scope to those portions of a coordinated water
18 system plan that are determined to be in need of updating. Any updates should be consistent
19 with the Washington State Growth Management Act and Island County Comprehensive
20 Plan.

21 The CWSP establishes a process by which utilities claim a specific area for the provision of
22 direct water service called a “service area.” Utilities generally establish boundaries consistent
23 with areas of denser platting similar to urban rather than rural settings. In Island County
24 patterns of development in the 1960s and 1970s resulted in many “islands” of platted lots
25 surrounded by large rural parcels of lands. Each of these subdivisions is served by either a
26 separate water system or multiple water systems.

27 The success of CWSP policies and procedures to limit the development of small public
28 water systems in Island County is questionable. The county experienced a significant increase
29 in individual well development since 1990, and there has been a significant increase in the
30 development of Group B system sources over Group A water system sources for the same
31 period of time (Note: Group B systems have 2-14 connections; Group A systems have 15 or
32 more connections). While Group A system sources are generally subject to the water right
33 permitting process with DOE, most Group B systems are developed under the permit
34 exemption. For the CWSP to be successful, better coordination is needed to encourage
35 existing purveyors to expand or join utilities.

36 The WRAC recognizes the CWSP process as an enforcement tool that would be highly
37 effective if reviewed, updated, and implemented. Financing for reopening the CWSP for
38 review may be available through the Washington State Community Development Block
39 Grant program. Reviewing the CWSP is timely, considering that the recently passed

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 Municipal Bill (HB 1338) applies to water rights and exempt wells. Main items to be
2 addressed within a review of the CWSP would be the following:

- 4 1. Maps of Service Areas: Comprehensive maps of public water systems are needed for
5 preventing and settling service area boundary disputes. These maps – most likely
6 geographic information system (GIS) layers – would show infrastructure, existing and
7 planned service areas, and would differentiate between areas of perfected or non-
8 perfected water rights. Updated maps would greatly assist the Island County Planning
9 and Community Development Department (Planning Department) which evaluates
10 water system updates and applications for overlaps between service areas as well as
11 inconsistencies with Growth Management Act requirements. Updating maps would also
12 give opportunity to define service area responsibilities for a public water system (ex.
13 water rights, storage requirements, financial viability).
- 14 2. “Timely and Reasonable” Definition: The Planning Department’s role in settling service
15 area disputes also involves determining who public water systems will serve. The
16 Municipal Water Law specifies that providers have a duty to provide water service within
17 their defined service area in a “timely and reasonable” manner. As the county legislative
18 body, the Board of Island County Commissioners (BICC) could help define the “timely
19 and reasonable” clause. The Planning Department has difficulty following-through with
20 purveyors, and often ends up working with potential new customers requesting
21 individual wells instead of being able to hook up to existing water supplies. This
22 difficulty is related to the Planning Department’s need to ensure consistency with State
23 Board of Health rules through using critical water supply service areas as an
24 enforcement tool for meeting water system design standards and increasing efficiencies.
- 25 3. Moratorium Issue: When public water systems are not able to comply with DOH water
26 system design standards, they are able to place a moratorium on granting additional
27 connections even within existing service areas. The ability to declare a moratorium gives
28 a public water system a higher level of land use authority than the county has intended.
29 Moratoriums are viewed by some as a method, or excuse, to limit growth within water
30 system service areas. The CWSP contains regulatory methods for design standard
31 compliance. The receivership process is a regulatory process available to enforce
32 compliance of water systems that are failing.
- 33 4. Notice Requirements for Service Area Expansion: The CWSP does not sufficiently
34 outline the notification process for expansion of service areas, especially for affected
35 property owners within or adjacent.
- 36 5. Streamline Bureaucracy: There is a need to clarify county department roles, and to define
37 protocols for internally routing an application through the different departments. The
38 Planning and Health Departments are each responsible for different aspects of public
39 water supply service areas. Delineating county department responsibilities would remove
40 a disincentive for coordination of water systems.

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

- 1 6. Incentives: Effective incentives need to accompany the regulatory tools outlined in
2 the CWSP. These incentives could be economic-based: funding mechanisms, reduced
3 fees, or education for purveyors on the benefits of economic efficiencies of larger
4 systems.
- 5
- 6 7. Protection of Public Water Systems: Exempt wells drilled within or adjacent to
7 service areas complicate resource management and pose water quality concerns
8 (seawater intrusion and contamination). The CWSP could contain methods for
9 preventing exempt wells being drilled within service areas (see Option #5 on page 11 for
10 a possible method).
- 11
- 12 8. Larger New Public Water Systems: Larger water systems tend to be better managed,
13 leading to reduced break downs and water leaks; they also tend to have better resource
14 management of their water supplies. An unmet goal of the CWSP was to encourage
15 larger water systems. The WRAC has identified options for improving the water rights
16 process in Island County (see "Water Rights" topic paper). Incentives and funding
17 sources also need to be provided for the development of larger new water systems.
- 18
- 19 9. Satellite Management Requirements: Future CWSP revisions may require more stringent
20 satellite management requirements and also must include policies and procedures to
21 address failing water systems for which counties may become responsible as receivers
22 (E2SSB 5448). (See discussion in Option #3.)
- 23
- 24 10. Conservation Measures: The CWSP recommends that all public water systems prepare
25 plans to implement conservation measures. In areas of seawater intrusion, there should
26 be active ongoing conservation measures in all public water systems. The CWSP also
27 recommends that Island County develop a comprehensive water conservation program
28 as a method for managing water resources on a long-term basis. Such programs should
29 be implemented along with Island County's Groundwater Management Plan. (See
30 discussion in Option #3.)
- 31

Option #2: Promote Water System Associations

Promoting the formation of water system associations within Island County would facilitate communication, and would help systems help each other. Systems increase their efficiencies when they share resources and information. The WRAC recognizes that initial meetings would need to be sponsored and facilitated until water system associations develop committed leadership and self-reliance.

The WRAC recognizes that operator and purveyor education is an important aspect of better water system management. Purveyor obligations and responsibilities regarding design standards and upgrades, and moratorium issues, are complex. Responsibilities between purveyors, the county, and State agencies must be delineated and clarified. Education would teach purveyors the technical skills needed to effectively manage their water systems. Education should be accompanied with regulatory enforcement (county and State

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 responsibilities; delineated within CWSP). Educational opportunities may exist when water
2 system plans are submitted for approval or review.

4 The Camano Water System Association is a local model for encouraging communication
5 between, and education of, purveyors. Successes from this association include having annual
6 “nuts and bolts” seminars, developing educational materials for Group B system operators,
7 and identifying industry sponsors for administrating meetings and workshops.

Management of Existing Public Water Systems

Option #3: Support County and State-wide Resource Planning and Management Efforts

13 The WRAC recognizes the importance of good resource planning and management for
14 existing public water systems. Good management reduces the incidence of break downs and
15 water leaks. Resource planning helps to ensure the availability of water supplies. Resource
16 planning and management help ensure that public water systems have the ability to accept
17 new customers within their service areas.

19 Island County and State-wide resource planning and management efforts are underway, both
20 focused on preventative measures for ensuring water quality and reliability. Island County is
21 expanding its programs to improve Group B water system management (Note: Group B
22 systems have 2-14 connections). The Washington State Department of Health (DOH) is
23 working to address deficiencies shown in its recent Group B sanitary survey report (“Group
24 B Project Report,” DOH Publication #331-243, November 2003).

26 The following are policy areas that the WRAC would monitor and provide comment on:

1. Exempt Wells Drilled Adjacent to or Within Service Areas. When water systems do not
29 comply with design standard planning and upgrades, and therefore do not have the
30 capacity to take on new customers, individual (usually “exempt”) wells are drilled within
31 and adjacent to service areas. This leads to future problems for that water system. The
32 proliferation of exempt wells is contrary to the goals of the 1990 Island County
33 Coordinated Water System Plan (CWSP). The CWSP outlines more coordination
34 between systems to help each other and reduce the need for exempt wells. Exempt wells
35 have become an accepted method of ensuring water supplies, and serve unique needs in
36 rural settings. However, exempt withdrawals have the potential to negatively impact
37 groundwater resources and/or public health. Exempt wells do not go through the
38 rigorous tests of availability prior to appropriation, and so have the potential to
39 significantly affect resource quality and quantity. While exempt wells do not pose an
40 immediate threat, the potential negative impacts of further development based primarily
41 upon such sources should be reduced as much as possible. Positive aspects of exempt
42 wells should be kept in mind, and solutions employed to address specific situations. (See
43 “Exempt Wells” topic paper for a more thorough discussion of exempt wells.)

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

- 1 2. Development of an Effective Public Water System Schedule for Island County. The
2 CWSP contains many regulatory tools; economic-based incentives could also be
3 developed.
- 4
5 3. Review of Group B System Water Quality Monitoring Requirements and Compliance.
6 Water quality is a public health concern more related to Group B than Group A systems
7 (Note: Group B systems have 2-14 connections; Group A systems have 15 or more
8 connections). Monitoring requirements for Group B systems include annual bacterial
9 testing, nitrate testing once every three years, and if at risk for seawater intrusion,
10 chloride testing twice annually. Group B sanitary surveys have shown a lack of
11 compliance with even this minimal water quality testing. Regulatory compliance
12 mechanisms combined with educational programs may improve water quality testing
13 compliance. It may be beneficial to evaluate the need to test for additional acute and
14 chronic contaminants in Group B systems.
- 15
16 4. Increase in the Financial Viability of Small and Large Water Systems. The CWSP
17 addresses the need for financial viability of small (often exempt) public water
18 systems. The use of exempt wells results in the development of small public water
19 systems that are owned, operated, and managed by small numbers of individuals or
20 entities, and so their financial viability can be problematic. In general, the provision
21 of service from larger public water systems results in a higher level of service, better
22 economy of scale, and more efficient use of resources. The WRAC recognizes the
23 need to identify funding sources for improving systems. Financial viability includes
24 planning for capital costs and collecting operation and capital funds from customers.
25 Financial viability of Group A systems is not currently included in routine sanitary
26 surveys; the WRAC recognizes the potential value of including financial viability review
27 within Group A sanitary surveys.
- 28
29 5. Increase the Number of Group B Systems Entering into Agreements with Satellite
30 Management Agencies. New Group B systems now require “satellite” management
31 (note: this only applies to systems with three or more connections). A satellite
32 management agency is an individual, purveyor, or entity that is approved by DOH to
33 own or operate more than one public water system on a regional or county-wide
34 basis, without the necessity for a physical connection between such systems. Over the
35 past few years the ICHD has seen an increase in the number of two-party systems
36 over the number of systems with three or more connections. Future CWSP revisions
37 may require more stringent satellite management requirements and also must include
38 policies and procedures to address failing water systems for which counties may
39 become responsible as receivers (E2SSB 5448). In addition to offering technical and
40 monitoring assistance to water systems, satellite management agencies are able to
41 take on administrative/business responsibilities. Employing a satellite management
42 agency is convenient for small systems and becomes more cost-effective for larger
43 systems. Island County currently has two state-approved satellite management
44 agencies: King Water Company and South Whidbey Water Services.

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 6. Increase Water Conservation and Efficiency Measures for all Public Water Systems. The
2 CWSP recommends that all public water systems prepare plans to implement
3 conservation measures. In areas of seawater intrusion, there should be active ongoing
4 conservation measures in all public water systems. The CWSP also recommends that
5 Island County develop a comprehensive water conservation program as a method for
6 managing water resources on a long-term basis. Such programs should be implemented
7 along with Island County's Groundwater Management Plan. Single wells are generally
8 not monitored or metered, and do not have the costs associated with such activities.
9 Therefore, there is less incentive for single wells to conserve water. New Group B and all
10 Group A systems are required to be metered and monitored. Group A systems are also
11 required to provide storage for fire flow. Since increased use equates to increased costs,
12 larger systems have more incentive to conserve. The WRAC recognizes the important
13 relation of encouraging conservation with ensuring safe and adequate water supplies (see
14 "Water Conservation" topic paper).

Consolidation of Public Water Systems

18 Larger systems, rather than a proliferation of smaller systems, provide a higher level of
19 protection of public health and the groundwater resource. Consolidation is considered to be
20 a long-term solution for addressing future water supply needs, and is an important
21 component of improved water system management. Consolidation of public water systems
22 involves encouraging larger systems to develop, through developing interties between
23 existing water systems. The WRAC supports streamlining any consolidation efforts desired
24 by existing water systems.

26 Consolidation offers public water systems the opportunity to decrease their operational and
27 development costs. Operational costs include water quality monitoring or management by a
28 third party certified operator. Development costs include construction and maintenance of
29 storage and distribution systems, engineering and design requirements, or planning
30 requirements. Costs may decrease with increased number of connections and shared
31 resources, leading to a better economy of scale.

33 The CWSP contains recommendations for consolidation of Group A and Group B water
34 systems (Note: Group B systems have 2-14 connections; Group A systems have 15 or more
35 connections). This includes consolidating very small water systems (perhaps 2-10
36 connections) into adjacent Group A systems where vacant connections are available. "There
37 are a number of opportunities for interties between systems in Island County as the
38 population and customer base increase. In many cases, intertied systems will become a
39 significant or primary supply to all or portions of the water service areas due to the limited
40 groundwater resources. In some instances, interties will be the standby or backup between
41 two water service areas that are expected to be relatively self-sufficient. In other instances
42 the intertie, in addition to providing supply for standby capability, will provide a primary
43 transmission/distribution loop and/or facilitate future extension of the water system. In all
44 cases, the interties should increase reliability of the water systems." (CWSP, 1990; p. VII-17)

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 The WRAC has identified the following methods of removing obstacles and providing
2 incentives for systems wanting to consolidate:

4 *Option #4: Remove Regulatory Disincentives for Consolidation*

6 This option involves reviewing ICHD and DOH regulations for adding connections and
7 interties, and allowing for flexibility in interpretation of these regulations. The benefits of
8 additional connections should be strongly considered when protecting public health. A
9 memorandum of understanding between DOH and ICHD could formalize DOH flexibility
10 of interpretation in specific cases. Steps in the consolidation process should be streamlined
11 to reduce the burden of shifting to Group A regulations.

13 *Option #5: Require Request for Existing Water Service Before Drilling New Wells*

15 Exempt wells drilled within or adjacent to service areas pose resource management and
16 public health threats to water systems. To better manage their groundwater resources, public
17 water systems need to be informed of wells drilled within and adjacent to their service areas.
18 Requiring all potential wells to request water service prior to drilling would provide a
19 notification mechanism for public water systems and the ICHD. This notification would
20 enable water systems to review potential impacts on their local groundwater resource.
21 Notification would also enable the ICHD to work with water systems to enforce protections
22 for their service areas, and to encourage sanitary setbacks and water quality inspections. The
23 Department of Ecology (DOE) could amend well driller guidelines to include checking for
24 existing water service prior to drilling any given well. Once a well driller submitted a drilling
25 application, DOE would then notify nearby water systems and the ICHD.

27 *Option #6: Add Value to State Revolving Funds for Consolidating Systems*

29 One method of encouraging consolidation may be to increase funding options. The State
30 Revolving Fund is a method of funding water system improvements, and has been a reliable
31 funding source for Group A system upgrades (Note: Group A systems have 15 or more
32 connections). State Revolving Fund monies may be available for a consolidation feasibility
33 study for Island County. In addition, the Island County Board of Health (BOH) could
34 request that DOH consider changing the State Revolving Fund scoring system to add value
35 for systems wanting to consolidate, therefore making consolidation more financially feasible.

37 Groundwater Redistribution

39 *Option # 7: Support Infrastructure Improvements for Groundwater Redistribution Efforts*

41 Groundwater redistribution is a water supply alternative for the future, to be implemented as
42 needed. The 1990 Island County Coordinated Water System Plan (CWSP) identifies efficient
43 development of local groundwater as Island County's most desirable and cost-effective water
44 supply option. The resource, however, may not be available where demands occur. The

WATER SYSTEM COORDINATION Topic Paper

Approved by the Water Resources Advisory Committee, 5/06/04

Approved by the Board of Island County Commissioners, 5/19/04

Island County / WRIA 6 Watershed Planning Process

1 CWSP outlines “redistribution of groundwater” (*Section V*) as its highest recommended
2 water supply alternative. At present very few water systems employ inter-ties for transfer of
3 water. Long distance transmission may be the only alternative to deliver adequate
4 groundwater to where it is needed. For a detailed description of this issue, please see the
5 “Water Supply Alternatives” topic paper.

6
7 Current Watershed Planning efforts may identify regions in which the potential for
8 localized redistribution exists. Care must be taken not to underestimate the local needs of
9 the area from which the water will be exported. Consideration of future land use
10 potential will limit the quantity of water available for distribution. Pipelines and
11 connections between water systems could relocate water from high quality/quantity wells
12 to areas where groundwater quality or quantity is below acceptable standards. To prepare
13 for this eventuality, water systems could begin to prepare for coordination with adjacent
14 systems through coordinating upgrades and design standards (e.g. matching hydraulics).
15 Planning for compatibility between systems would build capacity for the future.
